

Now fully integrated with Drupal

SPNet is an e-commerce module designed for companies wanting to promote and sell their products and services over the Internet.

SPNet creates a dynamic web site that can easily be tailored for a range of business scenarios. It allows organisations to trade and interact with their existing customers and also to potential new customers by showcasing their products via the Internet. At the same time its unique flexible design allows the system to be configured for the specific needs of each organisation.

Features include:

- On-line product enquiry and purchasing.
- SPNet links directly to the financial database to create a dynamic web site that automatically reflects changes in the underlying database. Existing customer, inventory and pricing information is used and there is therefore no requirement to maintain a separate Internet database.
- The resulting web site can be used by existing customers and prospective new clients, as well as branch offices and remote sales staff. All categories can be defined to run off a single web site.
- The flexible design allows the system administrator to maintain user groups, set options, limit access, define order prompts, send messages etc.
- NEW !!! - SPNet now integrates into the Drupal Content Management System (CMS). This allows for rapid design and layout of the web site using hundreds of available templates. Web content can easily be added and updated making maintenance of the web site a simple task.
- Includes embedded PayPal™ payment gateway for secure on-line credit card payments. In addition, bank specific payment gateways can easily be added into the system. Credit card payments can be used for both purchases and for paying off account balances.
- Existing customers can query outstanding orders, historical invoices and other business information.
- Tracking facility to monitor web site traffic and sales activity.
- Choice of web hosting options.
- Message Centre allows you to communicate with your customers via email and link them back into your web site.
